these universal remotes for garage door opener and thereby gain entry to your house.

This simple and easy and cheap CHAIN LOCK FOR GARAGE technique puts an end to that. Three inexpensive materials: a. strong steel carabiner clip, and b. steel eye screw that you open with pliers to connect to c. steel chain of minimum 8 inch length.

How to do it: Open eye screw to connect end of chain. When buying eye screw, get strongest you can get and still assure you can open it with pliers, or have store assistant do it.

Get two sets of materials if you want to lock both sides of garage door.

In garage, decide at what height you want to put chain lock. Chest level good enough for convenient reach, though it can go near floor or even higher near ceiling.

Drill a hole on flat edge of door track to insert steel carabiner clip. Hole drilled about halfway between two door panels hinges. Assure easy movement for clip by making this hole just larger than clip diameter. Insert clip with opening towards middle of door. On door jamb pre-drill a hole partway to fit eye screw, then using pliers twist in eye screw till eye ring meets wall.

Chain hanging from eye screw should reach clip to connect and secure door from raising. If using longer chain, you can raise door higher to allow air flow under it in summer.

This simple and cheap lock method can help you rest better knowing you have secured a vulnerable entry into your home.
